DETAILED ACTION

Examiner acknowledges receipt of 3/11/05 preliminary amendment to the abstract and claims which was entered into the file. Claims 1-4 are currently pending.

Specification

The substitute specification filed 4/29/05 has not been entered because it does not conform to 37 CFR 1.125(b) and (c) because: A substitute specification submitted under this section must be submitted with markings showing all the changes relative to the immediate prior version of the specification of record. The text of any added subject matter must be shown by underlining the added text. The text of any deleted matter must be shown by strike-through except that double brackets placed before and after the deleted characters may be used to show deletion of five or fewer consecutive characters. The text of any deleted subject matter must be shown by being placed within double brackets if strike-through cannot be easily perceived. An accompanying clean version (without markings) must also be supplied. Numbering the paragraphs of the specification of record is not considered a change that must be shown pursuant to this paragraph.

Therefore the claims and specification are examined as provided on 3/11/05.

Claim Objections

Claim 2 is objected to under 37 CFR 1.75(c), as being of improper dependent form for failing to further limit the subject matter of a previous claim. Applicant is required to cancel the claim(s), or amend the claim(s) to place the claim(s) in proper dependent form, or rewrite the claim(s) in independent form. Claim 2 is not further limiting as it requires the same mean oxide particle size (0.5-9.9 nm) as is claimed in claim 1.

Claim Rejections - 35 USC § 103

Claims 1-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ohmori et al (US 2002/0150531).

Art Unit: 1792

Claims 1-4: Ohmori teaches a process for coating a substrate, wherein a suspension of crystalline oxide particles (see, for example $\text{Sr}(\text{TiO})_3$, $\text{Ba}(\text{TiO})_3$, perovskite cubic crystalline structure, abstract, [0045]) having a mean particle size of from 10-100 nm (abstract), is applied to a substrate by coating (see, for example, dip coating, [0047]), the suspending medium (see, for example, ethyl alcohol, [0046]) is evaporated (drying step, [0047]) and the coating on the substrate is sintered (see for example firing at 500°C , [0048]).

Ohmori does not explicitly teach wherein the mean particle size is from 0.5 to 9.9 nm, but it would have been obvious to one of ordinary skill in the art at the time of invention to have incorporated a mean particles size 0.5 to 9.9 nm, since a prima facie case of obviousness exists where the claimed ranges and prior art ranges do not overlap but are close enough that one skilled in the art would have expected them to have the same properties. *Titanium Metals Corp. of America v. Banner*, 778 F.2d 775, 227 USPQ 773 (Fed. Cir. 1985).
